VGT:VGT_DRAW_INITIATOR · [W] · 32 bits · Access: 32 · GpuF0MMReg:0x287f0					
DESCRIPTION: Draw Initia	DESCRIPTION: Draw Inititiator				
Field Name	Bits	Default	Description		
SOURCE_SELECT	1:0	none	Input Source Select. If the Source Select field is set to `Auto-increment Index` mode and the Primitive Type is set to `Tri List w/Flags`,		

	11		1
			then the draw initiator is processed as just a regular `Tri List`.
			POSSIBLE VALUES: 00 - DI_SRC_SEL_DMA: VGT DMA Data 01 - DI_SRC_SEL_IMMEDIATE: Immediate Data
			02 - DI_SRC_SEL_AUTO_INDEX: Auto-increment
			Index
			03 - DI_SRC_SEL_RESERVED: Reserved - unused
MAJOR_MODE	3:2	none	Major Mode
			POSSIBLE VALUES:
			00 - DI_MAJOR_MODE_0: DI_MAJOR_MODE_0
			Normal (Implicit) Mode applies only to prim types 0-
			21. Some VGT state registers are ignored (their values implied) in this mode.
			01 - DI_MAJOR_MODE_1: DI_MAJOR_MODE_1
			Explicit Mode Configuration completely specified by
			state registers.
SPRITE_EN	4	none	sprite enable
			POSSIBLE VALUES:
			00 - disable sprite
			01 - enable sprite
NOT_EOP	5	none	This bit indicates that this draw initiator should not
			generate an end-of-packet signal because it will be
			followed by one or more chained draw initiators. Care
			must be taken so that this draw initiator is immediately followed, at the hardware interface, by a chained draw
			initiator. (In other words, chained draw initiators cannot
			be separated over driver buffer boundaries that can be
			interrupted. This bit is primarily intended to be set by the
			CP to improve the processing parallelism of small 2D
			blits.)
			POSSIBLE VALUES:
			00 - normal eop
			01 - suppress eop
USE_OPAQUE	6	none	This bit indicates that this draw call is a opaque draw call
			POSSIBLE VALUES:
			00 - non-opaque draw
			01 - opaque draw

DESCRIPTION: Event address				
Field Name	Bits	Default	Description	
ADDRESS_LOW	27:0	none	address bit 31:4 for zpass event	

VGT:VGT_EVENT_INITIATOR · [W] · 32 bits · Access: 32 · GpuF0MMReg:0x28a90					
DESCRIPTION: Event Initiator					
Field Name	Bits	Default	Description		
EVENT_TYPE	5:0	none	Event Type (also called Event ID) Currently, the hardware interface between the VGT and the PA supports only 6-bit event type. POSSIBLE VALUES: 00 - Reserved 01 - Reserved 02 - Reserved 03 - Reserved 04 - CACHE_FLUSH_TS: Destination Cache Flush with Timestamp Inserted by the driver to request the CBs, DBs, and SMX to signal the CP when all prior rendering is flushed to memory. 05 - CONTEXT_DONE: GFXDEC Context Done Inserted by the CP on the first GFXDEC state update after a draw. 06 - CACHE_FLUSH: Destination Caches Flushed Inserted by the driver to request the CBs, DBs, and SMX to flushed their caches to memory (No Timestamp is Generated). 07 - VIZQUERY_START: No longer supported 08 - VIZQUERY_END: No longer supported 09 - SC_WAIT_WC: SC Wait for WC from CP Inserted by the CP to inform the SC to wait for the write confirm signal (wire) from the CP before submitting future pixel vectors. This is used to synchronize 2D		

source surface (brush, a.ka. texture) with user of that surface.

- 10 MPASS_PS_CP_REFETCH: Multi-Pass Pixel Shader CP Refetch -- Inserted by the driver to inform the SC it needs to report to CP to refetch buffer for multipass pixel shader or continue.
- 11 MPASS_PS_RST_START: Multi-Pass Pixel Shader Reset Start -- Inserted by the driver just before an INDIRECT_BUFFER_MP packet to instruct the SC to reset the multi-pass start pixel vector.
- 12 MPASS_PS_INCR_START: Multi-Pass Pixel Shader Increment Start -- Inserted by the driver to instruct the SC to increment the multi-pass start vector by vectors_per_pass.
- 13 RST_PIX_CNT: Reset SQ`s auto Pixel Counter AND reset SC`s multi-pass pixel vector count -- Inserted by the driver.
- 14 RST_VTX_CNT: Reset SQ's auto Vertex Counter -- Inserted by the driver.
- 15 VS_PARTIAL_FLUSH: Used to flush all work between the CP and the ES, GS, VS shaders including the VGT.
- 16 PS_PARTIAL_FLUSH: Used to flush all work between the CP and the ES, GS, VS, PS shaders including scan conversion, primitive assembly, and VGT.
 - 17 Reserved
 - 18 Reserved
 - 19 Reserved
- 20 CACHE_FLUSH_AND_INV_TS_EVENT: Same as CACHE_FLUSH_TS with an invalidate --Inserted by the driver.
- 21 ZPASS_DONE: Write ZPASS counts to memory -- Inserted by the driver to instruct the DBs to write out the ZPASS counters to memory. Used to support DX10 occlusion queries.
- 22 CACHE_FLUSH_AND_INV_EVENT: Same as CACHE_FLUSH with an invalidate -- Inserted by the driver.
- 23 PERFCOUNTER_START: Start enabled event based Performance counters -- Inserted by the driver.
- 24 PERFCOUNTER_STOP: Stop enabled event based Performance counters that are event-enabled -- Inserted by the driver.
- 25 PIPELINESTAT_START: Start pipeline/strmout stat -- Inserted by the driver.
- 26 PIPELINESTAT_STOP: Stop pipeline/strmout stat -- Inserted by the driver.
- 27 PERFCOUNTER_SAMPLE: Sample the performance counters of all blocks -- Inserted by the driver to read the performance counters.
- 28 FLUSH_ES_OUTPUT: Flush Export Shader Output -- Inserted by the VGT to instruct the SMX to

			flush all the ES output to memory. 29 - FLUSH_GS_OUTPUT: Flush Geometry Shader Output Inserted by the VGT to instruct the SMX to flush all the GS output to memory. 30 - SAMPLE_PIPELINESTAT: Sample Pipeline Statistics counters Inserted by the driver to request the GPU to sample counters associated with pipelinestats.
			The CP will subsequently write them to memory. 31 - SO_VGTSTREAMOUT_FLUSH: VGT Streamout Flush This event will cause VGT to update the read only offsets registers and then send a VGT_CP_strmout_flushed to instruct the CP to read the offsets.
			32 - SAMPLE_STREAMOUTSTATS: Sample Streamout Statitics counters Inserted by the driver to request the GPU to sample counters associated with streamout. The CP will subsequently write them to memory.
			33 - RESET_VTX_CNT: Reset Vertex Count Inserted by the driver to reset the auto index count for vertex count. There are tow counters one for gs and non- gs and these should be reset seperately 34 - BLOCK_CONTEXT_DONE: Block Managed State (SQCONSDEC) Context Done - Inserted by the CP
			on the first SQCONSDEC constant update after a draw. 35 - CR_CONTEXT_DONE: CR Context Done Inserted by the driver with an EVENT_WRITE packet, before the first CR state update after a draw (CR_CMD register write)
			36 - VGT_FLUSH: VGT Flush - Inserted by the driver to cause the VGT to be flushed. Used when GS ring buffer sizes are changed 37 - CR_DONE_TS: CR Done Timestamp - Inserted by the driver to request a time stamp when the CR has
			completed previous work, flush of destination cache is assumed. 38 - SQ_NON_EVENT: SQ Non-Event This event is reserved for SQ 39 - SC_SEND_DB_VPZ: SC Send Depth Block VPort Z Inserted by the driver to cause the SC to send
			the vport array Zmin and Zmax values to the DBs. 40 - BOTTOM_OF_PIPE_TS: Bottom of the Pipe Timestamp Inserted by the driver to request a bottom of pipe timestamp be sent to memory, no flushing required.
LDDDEGG W	0.10		41 - Reserved 42 - DB_CACHE_FLUSH_AND_INV: DB Flush and Invalidate - Inserted by the driver when the depth surface is paged out of memory.
ADDRESS_HI	26:19	none	address bit 39:32 for zpass event
EXTENDED_EVENT	27	none	0 for single DW event, 1 for two DW event

	11]
			VGT_GRP_3D_LINE_ADJ 16 - VGT_GRP_3D_TRI_ADJ:
			VGT_GRP_3D_TRI_ADJ
RETAIN_ORDER		none	Resetting this bit to zero causes the Grouper within the VGT to convert strips, fans, loops, and polygons into regular lists in the vgt_grouper block. It also causes the primitive indices to be re-ordered to have the provoking vertex in the correct position. This bit should be set to zero if the VGT_OUTPUT_PATH_CNTL register specifies VGT_OUTPATH_VTX_REUSE or VGT_OUTPATH_TESS_EN and the VGT_DRAW_INITIATOR prim type is between 0 and 15, inclusive, (tri list, tri strip, tri fan, etc). This bit is implied to be zero for VGT_DRAW_INITIATOR prim types 0 thru 15 if the Major Mode of the VGT_DRAW_INITIATOR is 0. If this bit is set for prim types 0 thru 15, then the primitive index order from the grouper will be retained and the indices will be incorrect for loops, fans, and polygons. Note that if the VGT_DRAW_INITIATOR.MAJOR_MODE is set to MAJOR_MODE_1 and VGT_OUTPUT_PATH_CNTL is set to VGT_OUTPATH_PASSTHRU and the VGT_GROUP_PRIM_TYPE.PRIM_TYPE is set to VGT_GRP_3D_TRI or VGT_GRP_2D_TRI and VGT_GROUP_PRIM_TYPE.PRIM_ORDER is set to VGT_GRP_STRIP, then the passthru block will perform DX/OpenGL index re-ordering for tri-strips. POSSIBLE VALUES: 00 - Reorder strip/fan/loop/polygon into lists with correct provoking vertex 01 - Retain primitive index order as they appear in the input stream
RETAIN_QUADS	15	none	This bit can only be legally set if the VGT_OUTPUT_PATH_CNTL register specifies the Tessellation Engine and the Major Mode of the VGT_DRAW_INITATOR is 1. The RETAIN_QUADS bit indicates that quads should be passed intact to the tessellation engine. If this bit is not set, then the quads will be decomposed into triangles. POSSIBLE VALUES: 00 - Decompose quads into triangles 01 - Retain quads (legal only for tessellation engine)
PRIM_ORDER	18:16	none	Prim order output by grouper stage of the VGT. POSSIBLE VALUES: 00 - VGT_GRP_LIST: VGT_GRP_LIST 01 - VGT_GRP_STRIP: VGT_GRP_STRIP 02 - VGT_GRP_FAN: VGT_GRP_FAN 03 - VGT_GRP_LOOP: VGT_GRP_LOOP

DESCRIPTION: THIS REGISTER IS IGNORED IN MAJOR MODE 0 FOR PRIM TYPES 0 THRU 21!! This register indicates, with bits flags, which components are relevant for vector 0 of a group. At least one component of vector 0 must be indicated. This register also contains the stride of vector 0 (in 16-bit words) in the input stream and the amount to shift the input stream (in 16-bit words) after extracting the vector.

Field Name	Bits	Default	Description
COMP_X_EN	0	none	Indicates that component X will be output from the grouper for vector 0 POSSIBLE VALUES: 00 - disable 01 - enable
COMP_Y_EN		none	Indicates that component Y will be output from the grouper for vector 0 POSSIBLE VALUES: 00 - disable 01 - enable
COMP_Z_EN	2	none	Indicates that component Z will be output from the grouper for vector 0 POSSIBLE VALUES: 00 - disable 01 - enable
COMP_W_EN	3	none	Indicates that component W will be output from the grouper for vector 0 POSSIBLE VALUES: 00 - disable 01 - enable
STRIDE	15:8	none	The stride of vector 0 data in the input stream (in 16-bit words). Zero is NOT a legal value for an active vector. See the programming guidelines for the situation in which a vector uses no data from the shifter.
SHIFT	23:16	none	The amount to shift the input stream after extracting vector 0 (in 16-bit words). This field must be less than or equal to the STRIDE field for proper shifter operation.

VGT:VGT_HOS_CNTL · [R/W] · 32 bits · Access: 32 · GpuF0MMReg:0x28a14

DESCRIPTION: This register controls the behavior of the Tessellation Engine block at the backend of the VGT. This register is relevant only if the VGT_OUTPUT_PATH_CNTL register specifies the Tessellation Engine block for the VGT backend path. Note that the tessellation engine is enabled by selecting the tessellation engine path in the

VGT_OUTPUT_PATH_CNTL register as opposed to the single enable bit that was used in previous architectures.				
Field Name Bits Default Description				
TESS_MODE	1:0		Tessellation Mode 0 : Discrete 1 : Continuous 2 : Adaptive	

VGT:VGT_HOS_MAX_TESS_LEVEL · [R/W] · 32 bits · Access: 32 · GpuF0MMReg:0x28a18

DESCRIPTION: For continuous and discrete tessellation modes, this register contains the tessellation level. For adaptive tessellation, this register contains the maximum tessellation level. The adaptive tessellation levels will be clamped less-than or equal to this level by the tessellation engine. In all cases, the format of this register is 32-bit IEEE floating point. This register is relevant only when the VGT_OUT_CNTL register specifies `Tessellation Engine` in the Path Select field.

Field Name	Bits	Default	Description
MAX_TESS	31:0	none	For adaptive tessellation mode, this is the maximum tessellation clamp value. For continuous and discrete tessellation modes, this is the tessellation level. For discrete modes, values in the range (1.0, 14.0) are legal. For non-discrete modes, values in the range (1.0, 15.0) are legal. MAX_TESS must be greater than or equal to MIN_TESS.

VGT:VGT_HOS_MIN_TESS_LEVEL · [R/W] · 32 bits · Access: 32 · GpuF0MMReg:0x28a1c

DESCRIPTION: For continuous and discrete tessellation modes, this register is not applicable. For adaptive tessellation, this register contains the minimum tessellation level. The adaptive tessellation levels will be clamped greater-than or equal to this level by the tessellation engine. The format of this register is 32-bit IEEE floating point. This register is relevant only when the VGT_OUT_CNTL register specifies `Tessellation Engine` in the Path Select field and the VGT_HOS_CNTL register specifies adaptive tessellation mode.

Field Name	Bits	Default	Description
MIN_TESS	31:0		For adpative tessellation mode, this is the minimum tessellation clamp value. For continuous and discrete tessellartion modes, this register is not applicable. For discrete modes values in the range (1.0, 14.0) are legal. For non-discrete modes, values in the range (1.0, 15.0) are legal. MIN_TESS must be less than or equal to MAX_TESS.

DESCRIPTION: Line Drawing O	DESCRIPTION: Line Drawing Control				
Field Name	Bits	Default	Description		
BRES_CNTL	7:0	none	This field indicates what the hardware should do on the minor axis of the line, when the line is exactly half way between two pixels (bresenham error = 0). This field is a LUT (BRES_CNTL[7:0] w/ 1-bit per entry, where if the bit BRES_CNTL[index] = `1` then that means to step the minor axis. The 3-bit index is calculated from the attributes of the line ((abs(Xend - Xstart) >= abs(Yend -		

			Ystart)) << 2) ((Xstart <= Xend) << 1) (Ystart <= Yend)
USE_BRES_CNTL	8	none	If set, use the bresenham control field. Should be set for 2D lines, clear for 3D lines.
EXPAND_LINE_WIDTH	9		If set, the line width will be expanded by the 1/cos(a) where a the minimum angle from horz or vertical. This bit most likely should be set whenever MSAA_ENABLE is set or Line Antialiasing is being done in pixel shader.
LAST_PIXEL	10		If set the last pixel of a line will not be killed by the diamond exit rule.

			Sample 6: -5, 4
			Sample 7: 7, -8
CLIPRECT_ENABLE	1	none	Enables 4 cliprects (same as setting CLIPRECT_RULE to 0xffff)
LINE_STIPPLE_ENABLE	2	none	Enable line stipple processing
MULTI_CHIP_PRIM_DISCARD_ENAB LE	3	none	Enables primitives to be discarded based on PA_SC_MULTI_CHIP_CNTL. Should be disabled for stippled lines even when in Multi-Chip mode
WALK_ORDER_ENABLE	4	none	Enables fixed pattern for quad walk order. Must be disabled for overlapping blit rendering.
HALVE_DETAIL_SAMPLE_PERF	5	none	Enables the ability to halve the performance of the detail samplers in all MSAA modes.
WALK_SIZE	6	none	Defines the size of the SC walk stamp. 0 : walk by supertiles (32 bits); 1 : walk by tiles (8 bits).
WALK_ALIGNMENT	7	none	Defines the alignment value of the SC walker. 0 : align by supertiles (32 bits); 1 : align by tiles (8 bits).
WALK_ALIGN8_PRIM_FITS_ST	8	none	When alignment value is set to supertiles (32 bits), enables the walker to align by tiles (8 bits) if primitive fits within one supertile.
TILE_COVER_NO_SCISSOR	9	none	Disables the use of scissors when determining tile covered.
KILL_PIX_POST_HI_Z	10	none	If set, all pixels are killed in the SC after the HI-Z test. Typically set for VizQuery geometry
KILL_PIX_POST_DETAIL_MASK	11	none	If set, all pixels are killed in the SC after the detail mask. Can be used for performance info
MULTI_CHIP_SUPERTILE_ENABLE	12	none	Enables Multi-Chip supertile mode with the configuration defined in PA_SC_MULTI_CHIP_CNTL.
TILE_COVER_DISABLE	13	none	Disables tile covered (Hi-Z optimization) that is sent to the DBs.
FORCE_EOV_CNTDWN_ENABLE	14	none	Enables forcing out pixel vectors prematurely based on the cycle count programmed in PA_SC_ENHANCE::FORCE_EOV_MAX_CLK_CNT[11:0]

FORCE_EOV_TILE_ENABLE	15	Enables forcing out pixel vectors prematurely based on the tile count programmed in PA_SC_ENHANCE::FORCE_EOV_MAX_TILE_CNT[1 1:0]
FORCE_EOV_REZ_ENABLE	16	Enables forcing out pixel vectors prematurely based on the ReZ hang condition(ie. cache locked) detected in the DB
PS_ITER_SAMPLE	17	Enables per-sample (i.e. unique shader-computed value per sample) pixel shader execution.

DESCRIPTION: (1-state) SQ config options. The graphics pipe must be idle to change these.					
Field Name	Bits	Default	Description		
VC_ENABLE	0	0x0	Vertex Cache (VC) is present; set to zero to disable VC. When VC is disabled, all vertex fetches go through the TC rather than VC regardless of the instruction bit which selects TC/VC.		
EXPORT_SRC_C	1	0x0			
DX9_CONSTS	2	0x0	DX9 constant file mode. $(0 = dx10 \text{ constant cache} $ mode, $1 = dx9 \text{ constant file mode})$. This applies to all shaders.		
ALU_INST_PREFER_VECTOR	3	0x0	ALU clause instruction assignment. When a group of 4 or less instructions, there may be ambiguity whether to assign the last instruction to the vector pipe (according to the instruction's dest-chan), or to the scalar pipe (trans). This bit controls that decision: $0 = \text{send}$ the last instruction word to the scalar (trans) pipe if possible, $1 = \text{prefer}$ to send it to the vector pipe. This bit is only used when the decision is ambiguous (not ambiguous if: a vector-only or trans-only opcode, or the last instruction writes to the same dest-chan as another instruction in the group. The shader-compiler must be aware of this bit setting and compile accordingly. Default is: 0 (prefer-scalar).		
DX10_CLAMP	4	0x0	R600: DX10 clamp mode. (1 = dx10 mode, 0 = dx9 mode). This applies to all shaders. This affects how the SP output clamp treats NaN. NOT USED IN R6XX DERIVATIVES (see sq_pgm_resources_*)

DESCRIPTION: Control flow instruction word 0. This word is the default representation for CF instructions.				
Field Name	Bits	Default	Description	
ADDR	31:0	none	Bits [34:3] of the byte offset (producing a QUAD-word-aligned value) of the clause to execute (clause instructions only). Bits [34:3] of the byte offset (producing a QUAD-word-aligned value) of the control flow address to jump to (instructions that can jump). Offsets are relative to the byte address specified by PGM_START. Texture & Vertex clauses must start on 16-byte aligned addresses.	

SQ_MICRO:SQ_CF_WORD1	· [R/W] ·	32 bits · 1	Access: 32 · GpuF0MMReg:0x8dfc	
DESCRIPTION: Control flow instruction word 1. This word is the default representation for CF instructions.				
Field Name	Bits	Default	Description	
POP_COUNT	2:0	none	Specify the number of entries to pop from the stack, in [07]. Only used by certain CF instructions that pop the branch-loop stack. May be zero, to indicate no pop operation.	
CF_CONST	7:3	none	Specify the CF constant to use for flow control statements. For LOOP/ENDLOOP, this specifies the integer constant to use for the loop counter, loop index initializer, and increment. For instructions using COND, this specifies the index of the boolean constant to use.	
COND	9:8	none	Specifies how to evaluate the condition test for each pixel. Not used by all instructions. May reference CF_CONST. POSSIBLE VALUES: 00 - SQ_CF_COND_ACTIVE: condition test passes for active pixels. 01 - SQ_CF_COND_FALSE: contition test fails for all pixels. 02 - SQ_CF_COND_BOOL: condition test passes iff pixel is active and boolean referenced by CF_CONST is true. 03 - SQ_CF_COND_NOT_BOOL: condition test passes iff pixel is active and boolean referenced by CF_CONST is false.	
COUNT	12:10	none	Number of instructions to execute in the clause, minus one (clause instructions only). This is interpreted as the number of instruction slots in the range [1,8].	
CALL_COUNT	18:13	none	Amount to increment call nesting counter by when executing a CALL statement; a CALL is skipped if the current nesting depth + call_count > 32. This field is interpreted in the range [0,31], and has no effect for other	

			instruction types.
END_OF_PROGRAM	21	none	If set, then this instruction is the last instruction of the CF program. Execution ends after this instruction is issued.
VALID_PIXEL_MODE	22	none	If set, execute this instruction/clause as if invalid pixels are inactive. Antonym of WHOLE_QUAD_MODE. Caution: VALID_PIXEL_MODE is not the `default` mode; this bit should be set to 0 by default.
CF_INST	29:23	none	Type of instruction to evaluate in CF. For this encoding, CF_INST must be set to one of the following values. POSSIBLE VALUES: 00 - SQ_CF_INST_NOP: perform no operation. 01 - SQ_CF_INST_TEX: execute texture fetch or constant fetch clause. CF_COND=ACTIVE is required. 02 - SQ_CF_INST_VTX: execute vertex fetch clause. CF_COND=ACTIVE is required. 03 - SQ_CF_INST_VTX_TC: execute vertex fetch clause through the texture cache (for systems lacking VC). CF_COND=ACTIVE is required. 04 - SQ_CF_INST_LOOP_START: execute DX9 loop start instruction (push onto loop stack if loop body executes). 05 - SQ_CF_INST_LOOP_END: execute DX9 loop end instruction (pop loop stack if loop is finished). 06 - SQ_CF_INST_LOOP_START_DX10: execute DX10 loop start instruction (push onto loop stack if loop body executes). 07 - SQ_CF_INST_LOOP_START_NO_AL: same as LOOP_START but don't push AL onto stack or update AL. 08 - SQ_CF_INST_LOOP_CONTINUE: execute continue statement (jump to end of loop if all pixels ready to continue). 09 - SQ_CF_INST_LOOP_BREAK: execute a break statement (pop loop stack if all pixels ready to break). 10 - SQ_CF_INST_JUMP: execute jump statement (may be conditional). 11 - SQ_CF_INST_PUSH: push current per-pixel active state onto stack OR jump and pop if no items would be active. 12 - SQ_CF_INST_PUSH_ELSE: push current perpixel active state onto stack ND jump if no items would be active. 13 - SQ_CF_INST_PUSH_ELSE: execute else statement (may be conditional) OR jump if no items would be active. 14 - SQ_CF_INST_POP: pop current per-pixel state from the stack. jump if no pixels were enabled prior to pop. 15 - SQ_CF_INST_POP_JUMP: pop current perpixel state from the stack. then execute CF_INST_JUMP

WHOLE QUAD MODE	30	none	with pop count = 0. 16 - SQ_CF_INST_POP_PUSH: pop current perpixel state from the stack. then execute CF_INST_PUSH with pop count = 0. 17 - SQ_CF_INST_POP_PUSH_ELSE: pop current per-pixel state from the stack. then execute CF_INST_PUSH_ELSE. 18 - SQ_CF_INST_CALL: execute subroutine call instruction (push onto address stack). 19 - SQ_CF_INST_CALL_FS: call fetch shader. The address to call is stored in a state register in SQ. 20 - SQ_CF_INST_RETURN: execute subroutine return instruction (pop address stack). Pair with CF_INST_CALL only. 21 - SQ_CF_INST_EMIT_VERTEX: signal that GS has finished exporting a vertex to memory. CF_COND=ACTIVE is required. 22 - SQ_CF_INST_EMIT_CUT_VERTEX: emit a vertex and an end of primitive strip marker. The next emitted vertex will start a new primitive strip. CF_COND=ACTIVE is required. 23 - SQ_CF_INST_CUT_VERTEX: emit an end of primitive strip marker. The next emitted vertex will start a new primitive strip marker. The next emitted vertex will start a new primitive strip marker. The next emitted vertex will start a new primitive strip. CF_COND=ACTIVE is required. 24 - SQ_CF_INST_KILL: kill pixels that pass the condition test (may be conditional). jump if all pixels are killed. CF_COND=ACTIVE is required.
WHOLE_QUAD_MODE	30	none	If set, execute this instruction/clause as if all pixels are active and valid. Antonym of VALID_PIXEL_MODE. Set at most one of these bits.
BARRIER	31	none	If set, all prior CF instructions/clauses must complete before this instruction/clause executes. If not set, this instruction/clause may run in parallel with prior instructions.

DESCRIPTION: Control flow instruction word 1. This word is used by ALU clause instructions.				
Field Name	Bits	Default	Description	
KCACHE_MODE1	1:0	none	Mode for second set of locked cache lines. POSSIBLE VALUES: 00 - SQ_CF_KCACHE_NOP: do not lock any cache lines. 01 - SQ_CF_KCACHE_LOCK_1: lock cache line [bank][addr]. 02 - SQ_CF_KCACHE_LOCK_2: lock cache lines [bank][addr] and [bank][addr+1]. 03 - SQ_CF_KCACHE_LOCK_LOOP_INDEX: lock cache lines [bank][loop/16+addr] and [bank][loop/16+addr+1], where loop is current loop index.	
KCACHE_ADDR0	9:2	none	Constant buffer address for first set of locked cache lines. In units of cache lines where a line holds 16 128-bit constants (byte addr[15:8]).	
KCACHE_ADDR1	17:10	none	Constant buffer address for second set of locked cache lines.	
COUNT	24:18	none	Number of instructions to execute in the clause, minus one. This is interpreted as the number of instruction slots (64-bit slots) in the range [1,128].	
USES_WATERFALL	25	none	If set, then this ALU clause uses waterfall constants (GPR-based indexing).	
CF_INST	29:26	none	Type of ALU instruction to evaluate in CF. For this encoding, CF_INST must be set to one of the following values. POSSIBLE VALUES: 08 - SQ_CF_INST_ALU: each PRED_SET updates the active state but does not update the stack. 09 - SQ_CF_INST_ALU_PUSH_BEFORE: do CF_PUSH; then CF_INST_ALU 10 - SQ_CF_INST_ALU_POP_AFTER: do CF_INST_ALU; then do CF_INST_POP. 11 - SQ_CF_INST_ALU_POP2_AFTER: do	

			CF_INST_ALU; then do CF_INST_POP twice. 13 - SQ_CF_INST_ALU_CONTINUE: each PRED_SET causes a continue operation on the masked pixels. Equivalent to CF_INST_PUSH; CF_INST_ALU; CF_INST_ELSE; CF_INST_CONTINUE; CF_POP. 14 - SQ_CF_INST_ALU_BREAK: each PRED_SET causes a break operation on the masked pixels. Equivalent to CF_INST_PUSH; CF_INST_ALU; CF_INST_ELSE; CF_INST_CONTINUE; CF_POP. 15 - SQ_CF_INST_ALU_ELSE_AFTER: do CF_INST_ALU; then do CF_INST_ELSE.
WHOLE_QUAD_MODE	30	none	If set, execute this instruction/clause as if all pixels are active and valid. Antonym of VALID_PIXEL_MODE. Set at most one of these bits.
BARRIER	31		If set, all prior CF instructions/clauses must complete before this instruction/clause executes. If not set, this instruction/clause may run in parallel with prior instructions.

SQ_MICRO:SQ_CF_ALLOC_	EXPORT_V	VORD0 ·	[R/W] · 32 bits · Access: 32 · GpuF0MMReg:0x8dfc
DESCRIPTION: Word 0 of the o	control flow	instruction f	for alloc/export.
Field Name	Bits	Default	Description
ARRAY_BASE	12:0	none	For scratch/reduction input/output, this is the base address of the array in multiples of 4 dwords [0,32764]. For stream/ring output, this is the base addess of the array in multiples of 1 dword [0,8191]. For pixel/z output, this is the index of the first export (framebuffer, no fog: 07; framebuffer, with fog: 1623; computed Z: 61). For parameter output, this is the parameter index of the first export [0,31]. For position output, this is the position index of the first export [60,63].
ТҮРЕ	14:13	none	Type of allocation/export. In the table below, the first enumeration value listed (PIXEL, POS, PARAM) is used with CF_INST_EXPORT*. The second enumeration value listed (WRITE, WRITE_IND, READ, and READ_IND) is used with CF_INST_MEM*. POSSIBLE VALUES: 00 - SQ_EXPORT_PIXEL: write pixel. SQ_EXPORT_WRITE: write to memory buffer. 01 - SQ_EXPORT_POS: write position. SQ_EXPORT_WRITE_IND: write to memory buffer, use offset in INDEX_GPR.

			02 - SQ_EXPORT_PARAM: write parameter cache. SQ_EXPORT_READ: read from memory buffer (scratch and reduction only). 03 - Unused for SX exports. SQ_EXPORT_READ_IND: read from memory buffer, use offset in INDEX_GPR (scratch and reduction only).
RW_GPR	21:15	none	GPR register to read data from or write data to.
RW_REL	22	none	Indicates whether GPR is an absolute address, or relative to the loop index. POSSIBLE VALUES:
			00 - SQ_ABSOLUTE: no relative addressing. 01 - SQ_RELATIVE: add current loop index value to this address.
INDEX_GPR	29:23	none	For any indexed export, this GPR contains an index that will be used in the computation for determining the address of the first export. The index is multipled by (ELEM_SIZE + 1). Only the X component is used (other components ignored, no swizzle allowed).
ELEM_SIZE	31:30	none	Number of DWORDs per element, minus one. This field is interpreted as a value in [1,4]. The value from INDEX_GPR and the loop counter are multiplied by this factor, if applicable. Also, BURST_COUNT is multiplied by this factor for CF_INST_MEM*. This field is ignored for CF_INST_EXPORT*. Normally, ELEMSIZE = 4 DWORDs for scratch & reduction, one DWORD for other types.

DESCRIPTION: Word 1 of the control flow instruction for alloc/export is the bitwise OR of WORD1 WORD1_{BUF,SWIZ}. This part contains fields that are always defined.				
Field Name	Bits	Default	Description	
BURST_COUNT	20:17	none	Number of MRTs, positions, parameters, or logical export values to allocate and/or export, minus one. This field is interpreted as a value in [1,16].	
END_OF_PROGRAM	21	none	If set, then this instruction is the last instruction of the CF program. Execution ends after this instruction is issued.	
VALID_PIXEL_MODE	22	none	If set, execute this instruction/clause as if invalid pixels are inactive. Antonym of WHOLE_QUAD_MODE. Caution: VALID_PIXEL_MODE is not the `default` mode; this bit should be set to 0 by default.	
CF_INST	29:23	none	Type of instruction to evaluate in CF. This value MUST be one of the alloc/export instructions listed below. POSSIBLE VALUES: 32 - SQ_CF_INST_MEM_STREAM0: perform a memory operation on the stream buffer 0 (write-only).	

WHOLE OLIAD MODE	30	none	33 - SQ_CF_INST_MEM_STREAM1: perform a memory operation on the stream buffer 1 (write-only). 34 - SQ_CF_INST_MEM_STREAM2: perform a memory operation on the stream buffer 2 (write-only). 35 - SQ_CF_INST_MEM_STREAM3: perform a memory operation on the stream buffer 3 (write-only). 36 - SQ_CF_INST_MEM_SCRATCH: perform a memory operation on the scratch buffer (read-write). 37 - SQ_CF_INST_MEM_REDUCTION: perform a memory operation on the reduction buffer (read-write). 38 - SQ_CF_INST_MEM_RING: perform a memory operation on the ring buffer (write-only). 39 - SQ_CF_INST_EXPORT: export only (not last). Used for PIXEL, POS, PARAM exports. 40 - SQ_CF_INST_EXPORT_DONE: export only (last export). Used for PIXEL, POS, PARAM exports.
WHOLE_QUAD_MODE	30	none	If set, execute this instruction/clause as if all pixels were active and valid.
BARRIER	31	none	If set, all prior CF instructions/clauses must complete before this instruction/clause executes. If not set, this instruction/clause may run in parallel with prior instructions.

DESCRIPTION: ALU instruction word 1 is the bitwise OR of SQ_ALU_WORD1 SQ_ALU_WORD1_OP[2,3]. SQ_ALU_WORD1 contains fields used by all encodings.			
Field Name	Bits	Default	Description
ENCODING	17:15	none	A read-only field used to determine whether OP2 or OP3 encoding is being used. If this field's value is 0, the instruction is using OP2. Otherwise, the instruction is using OP3. Do not write to this field directly.
BANK_SWIZZLE	20:18	none	Specify how to load operands into the SP. POSSIBLE VALUES: 00 - SQ_ALU_VEC_012, SQ_ALU_SCL_210 01 - SQ_ALU_VEC_021, SQ_ALU_SCL_122 02 - SQ_ALU_VEC_120, SQ_ALU_SCL_212 03 - SQ_ALU_VEC_102, SQ_ALU_SCL_221

			04 - SQ_ALU_VEC_201 05 - SQ_ALU_VEC_210
DST_GPR	27:21	none	Destination address to write result to. Always a GPR address.
DST_REL	28	none	If set, this operand uses relative addressing based on the INDEX_MODE. POSSIBLE VALUES: 00 - SQ_ABSOLUTE: no relative addressing. 01 - SQ_RELATIVE: add index from INDEX_MODE to this address
DST_CHAN	30:29	none	Specify which channel of DST_GPR to write the result to. POSSIBLE VALUES: 00 - CHAN_X: write to X channel of dest. 01 - CHAN_Y: write to Y channel of dest. 02 - CHAN_Z: write to Z channel of dest. 03 - CHAN_W: write to W channel of dest.
CLAMP	31	none	If set, clamp the result to [0.0, 1.0]. Not mathematically defined for opcodes that produce integer results.

DESCRIPTION: ALU instruction word 1. This subencoding is used for OP2 instructions (instructions taking 0 to 2 operands).			
Field Name	Bits	Default	Description
SRC0_ABS	0	none	If set, take the absolute value of the input for this operand. Should only be set for floating point inputs; performed before negation.
SRC1_ABS	1	none	If set, take the absolute value of the input for this operand. Should only be set for floating point inputs; performed before negation.
UPDATE_EXECUTE_MASK	2	none	If set, update the execute mask in the SQ after executing this instruction based on the current predicate.
UPDATE_PRED	3	none	If set, update the predicate in the SP based on the predicate operation computed here.
WRITE_MASK	4	none	If set, write this scalar result to the destination GPR channel.
FOG_MERGE	5	none	If set, export fog value by merging the transcendental ALU result into the low-order bits of the vector destination. The vector results will lose some precision. This bit takes effect when set on the scalar instruction.
OMOD	7:6	none	Output modifier for this instruction. Must be set to ALU_OMOD_OFF for operations that produce an integer result.

SQ_MICRO:SQ_CF_ALLOC_I	EXPORT_V	VORD0 ·	[R/W] · 32 bits · Access: 32 · GpuF0MMReg:0x8dfc	
DESCRIPTION: Word 0 of the control flow instruction for alloc/export.				
Field Name	Bits	Default	Description	
ARRAY_BASE	12:0	none	For scratch/reduction input/output, this is the base address of the array in multiples of 4 dwords [0,32764]. For stream/ring output, this is the base addess of the array in multiples of 1 dword [0,8191]. For pixel/z output, this is the index of the first export (framebuffer 07; computed Z: 61). For parameter output, this is the parameter index of the first export [0,31].	
			For position output, this is the position index of the first export [60,63].	
ТҮРЕ	14:13	none	Type of allocation/export. In the table below, the first enumeration value listed (PIXEL, POS, PARAM) is used with CF_INST_EXPORT*. The second enumeration value listed (WRITE, WRITE_IND, WRITE_ACK, WRITE_IND_ACK) is used with CF_INST_MEM*. POSSIBLE VALUES: 00 - SQ_EXPORT_PIXEL: write pixel.	

			SQ_EXPORT_WRITE: write to memory buffer. 01 - SQ_EXPORT_POS: write position. SQ_EXPORT_WRITE_IND: write to memory buffer, use offset in INDEX_GPR. 02 - SQ_EXPORT_PARAM: write parameter cache. SQ_EXPORT_WRITE_ACK: write to memory buffer, request an ACK when write is committed to memory. 03 - Unused for SX exports. SQ_EXPORT_WRITE_IND_ACK: write to memory buffer with offset in INDEX_GPR, get an ACK when done.
RW_GPR	21:15	none	GPR register to write data to.
RW_REL	22	none	Indicates whether GPR is an absolute address, or relative to the loop index. POSSIBLE VALUES: 00 - SQ_ABSOLUTE: no relative addressing. 01 - SQ_RELATIVE: add current loop index value to this address.
INDEX_GPR	29:23	none	For any indexed export, this GPR contains an index that will be used in the computation for determining the address of the first export. The index is multipled by (ELEM_SIZE + 1). Only the X component is used (other components ignored, no swizzle allowed).
ELEM_SIZE	31:30	none	Number of DWORDs per element, minus one. This field is interpreted as a value in [1,2,4] (3 not supported). The value from INDEX_GPR and the loop counter are multiplied by this factor, if applicable. Also, BURST_COUNT is multiplied by this factor for CF_INST_MEM*. This field is ignored for CF_INST_EXPORT*. Normally, ELEMSIZE = 4 DWORDs for scratch & reduction, one DWORD for other types.

DESCRIPTION: Word 1 of the control flow instruction for alloc/export is the bitwise OR of WORD1 WORD1_{BUF,SWIZ}. This part contains fields that are always defined.					
	7	11			
Field Name	Bits	Default	Description		
BURST_COUNT	20:17	none	Number of MRTs, positions, parameters, or logical export values to allocate and/or export, minus one. This field is interpreted as a value in [1,16].		
END_OF_PROGRAM	21	none	If set, then this instruction is the last instruction of the CF program. Execution ends after this instruction is issued.		
VALID_PIXEL_MODE	22	none	If set, execute this instruction/clause as if invalid pixels are inactive. Antonym of WHOLE_QUAD_MODE. Caution: VALID_PIXEL_MODE is not the `default` mode; this bit should be set to 0 by default.		

CF_INST	29:23	none	Type of instruction to evaluate in CF. This value MUST be one of the alloc/export instructions listed below. POSSIBLE VALUES: 32 - SQ_CF_INST_MEM_STREAM0: perform a memory operation on the stream buffer 0 (write-only). 33 - SQ_CF_INST_MEM_STREAM1: perform a memory operation on the stream buffer 1 (write-only). 34 - SQ_CF_INST_MEM_STREAM2: perform a memory operation on the stream buffer 2 (write-only). 35 - SQ_CF_INST_MEM_STREAM3: perform a memory operation on the stream buffer 3 (write-only). 36 - SQ_CF_INST_MEM_SCRATCH: perform a memory operation on the scratch buffer (read-write). 37 - SQ_CF_INST_MEM_REDUCTION: perform a memory operation on the reduction buffer (read-write). 38 - SQ_CF_INST_MEM_RING: perform a memory operation on the ring buffer (write-only). 39 - SQ_CF_INST_EXPORT: export only (not last). Used for PIXEL, POS, PARAM exports. 40 - SQ_CF_INST_EXPORT_DONE: export only (last export). Used for PIXEL, POS, PARAM exports.
WHOLE_QUAD_MODE	30	none	If set, execute this instruction/clause as if all pixels were active and valid.
BARRIER	31	none	If set, all prior CF instructions/clauses must complete before this instruction/clause executes. If not set, this instruction/clause may run in parallel with prior instructions.

9. Shader ALU Constants

SQ:SQ_ALU_CONSTANT0_0 · [R/W] · 32 bits · Access: 32 · GpuF0MMReg:0x30000

DESCRIPTION: (64-state) ALU Constant store data for use in DX9 mode (DX10 mode uses the constant-cache instead and this constant-file is not available). All four components of a constant must be written for that constant to be updated - the physical write to the constant store only occurs after the fourth component has been written. The first set of 256 constants (0-255) are reserved for the pixel shader (PS). The second set of 256 constants (256-511) are reserved for the vertex shader (VS). None are available to the GS or ES.

UNCACHED_FIRST_INST	28	0x0	Ensure that the first instruction is not read from the first instruction cache. Should only be used for debugging if there is a problem with the cache.	

SQ:SQ_PGM_RESOURCES_FS · [R/W] · 32 bits · Access: 32 · GpuF0MMReg:0x288a4

DESCRIPTION: (8-state). Resource requirements to run the FS program. The FS shares with either the VS (gs-off) or ES (gs-on) and performs a single allocation equal to the VS+FS or ES+FS resource requirements. The SPI allocates stack space as (VS/ES + FS_stack_size) in the same manner as GPRs. Max_call_depth and fetch_cache_lines will be inherited from the parent shader (VS or ES). Can only read most recent version, not all 8 states.

DESCRIPTION: Control setting idle.	gs for all L	Data Caches.	These settings should only be changed when the SMX is			
Field Name	Bits	Default	Description			
WR_GATHER_STREAM0	0	0x1	For Stream0 traffic, use write gather on a write miss. To be used in the case when there will be many writes to memory. This allows SMX to send writes directly to the memory without having to first fetch the cache line from memory to the data caches.			
WR_GATHER_STREAM1	1	0x1	For Stream1 traffic, use write gather on a write miss. To be used in the case when there will be many writes to memory. This allows SMX to send writes directly to the memory without having to first fetch the cache line from memory to the data caches.			
WR_GATHER_STREAM2	2	0x1	For Stream2 traffic, use write gather on a write miss. To be used in the case when there will be many writes to memory. This allows SMX to send writes directly to the memory without having to first fetch the cache line from memory to the data caches.			
WR_GATHER_STREAM3	3	0x1	For Stream3 traffic, use write gather on a write miss. To be used in the case when there will be many writes to memory. This allows SMX to send writes directly to the memory without having to first fetch the cache line from memory to the data caches.			
WR_GATHER_SCRATCH	4	0x1	For Scratch traffic, use write gather on a write miss. To be used in the case when there will be many writes to memory. This allows SMX to send writes directly to the memory without having to first fetch the cache line from memory to the data caches.			
WR_GATHER_REDUC_BUF	5	0x1	For Reduction Buffer traffic, use write gather on a write miss. To be used in the case when there will be many writes to memory. This allows SMX to send writes directly to the memory without having to first fetch the cache line from memory to the data caches.			
WR_GATHER_RING_BUF	6	0x1	For Ring Buffer traffic, use write gather on a write miss. To be used in the case when there will be many writes to memory. This allows SMX to send writes directly to the memory without having to first fetch the cache line from memory to the data caches.			
WR_GATHER_F_BUF	7	0x1	For F Buffer traffic, use write gather on a write miss. To be used in the case when there will be many writes to memory. This allows SMX to send writes directly to the memory without having to first fetch the cache line from memory to the data caches.			
DISABLE_CACHES	8	0x0	Disables all Data Caches and turns on the bypass path. WARNING: Only write requests can be handled while caches are disabled. Read requests will still go to			

			memory but read returns will be dropped by the SMX.
AUTO_FLUSH_INVAL_EN	10	0x0	Valid only if AUTO_FLUSH_EN is set. Will cause auto-invalidate as well as auto-flush
AUTO_FLUSH_EN	11	0x1	Turn on Auto Flush of caches. All caches will automatically flush after AUTO_FLUSH_CNT idle cycles.
AUTO_FLUSH_CNT	27:12	0x2710	Nr of idle cycles after which all caches will automatically flush.
MC_RD_STALL_FACTOR	29:28	0x1	How easily SMX will assert MC's read info stall bit. 2'd3 = only if cache_ctl_op_fifo_stalled, 2'd2 = as in 2 and if any VFA is full, 2'd1 = as in 1 and if IB full, 2'd0 = SMX will never assert read info stall bit.
MC_WR_STALL_FACTOR	31:30	0x1	How easily SMX will assert MC's write info stall bit. 2'd3 = only if MU's L2 victim cache or wr req fifo stalled, 2'd2 = as in 2 and if any VFA is full, 2'd1 = as in 1 and if IB full, 2'd0 = SMX will never assert write info stall bit.

SMX:SMX_DC_CTL1 · [R/W] · 32 bits · Access: 32 ·	GpuF0	MMReg	:0xa024				
DESCRIPTION: Control settings for all Data Caches. These settings should only be changed when the SMX is idle.							
Field Name	Bits	Default	Description				
OP_FIFO_SKID	6:0	0x1	Skid for Cache Operation Fifo. Must be at least 1.				
CACHE_LINE_SIZE	8	0x0	Selects between 32-byte (CL32) or 64-byte (CL64) size cache lines. Note that CL64 has double the cache line width but half the number of cache lines as CL32. Since the SMX MC write and read interfaces are only 32 bytes wide, a 64 byte cache line transfer takes 2 consecutive cycles over the MC interface, this makes more efficient use of MC bandwidth. POSSIBLE VALUES: 00 - CL32: 32 byte (256 bit) Cache Line size 01 - CL64: 64 byte (512 bit) Cache Line size				
MULTI_FLUSH_MODE	9	0x1	Allows multiple outstanding flushes to be in flight without stalling the pipeline. Only for ES/GS Flush and Flush and/or invalidate all events. Multi-Flush mode does not exist in RV630.				
MULTI_FLUSH_REQ_ABORT_IDX_FIFO_SKID	13:10	0x1	Skid for Multi-Flush Engine's Flush				

			Request Abort Index Fifo. Must be at least 1.
DISABLE_WR_GATHER_RD_HIT_FORCE_EVICT	16	0x0	A Read hit of a write-gathering cacheline forces it to first evict to memory then read back to ensure coherency. Setting this bit allows you to read the line without evicting it first, but coherency (of cache vs memory) is not guaranteed.
DISABLE_WR_GATHER_RD_HIT_COMP_VLDS_CHECK	17	0x0	In a write-gathering cacheline, a read tag check also checks if the comp valid bits allow a read to be serviced from cache, else it is evicted and read back. Setting this bit disables the comp valid checking forcing any read hit to a write gathering cacheline to evict to memory and read back.
DISABLE_FLUSH_ES_ALSO_INVALS	18	0x0	A Flush ES event also invalidates all ES lines in the caches. Disabling this will reduce cache's ability to process incoming requests while flushing, reducing performance.
DISABLE_FLUSH_GS_ALSO_INVALS	19	0x0	A Flush GS event also invalidates all GS lines in the caches. Disabling this will reduce cache's ability to process incoming requests while flushing, reducing performance.

Field Name	Bits	Default	Description	
BASE_256B	31:0		Location of the first byte of the Depth surface in Device Address Space, which must be 256 byte aligned. High 32-bits of 40-bit address.	

DB:DB_DEPTH_CLEAR · [R/W] · 32 bits · Access: 32 · GpuF0MMReg:0x2802c				
Field Name	Bits	Default	Description	
DEPTH_CLEAR	31:0		Depth value when ZMASK==0, which indicates that the tile has been cleared to the background depth. This register holds a 32bit float value.	

DB:DB_DEPTH_CONTROL · [R/W] · 32 bits · Access: 32 · GpuF0MMReg:0x28800				
DESCRIPTION: This register controls depth and stencil tests.				
Field Name	Bits	Default	Description	
STENCIL_ENABLE	0	none	Enables stencil testing. If disabled, all pixels pass the stencil test. If there is no stencil buffer this is treated as disabled.	
Z_ENABLE	1	none	Enables depth testing. If disabled, all pixels pass the depth test. If there is no depth buffer this is treated as disabled.	
Z_WRITE_ENABLE	2	none	Enables writing to the depth buffer if the depth test passes.	
ZFUNC	6:4	none	Specifies the function that compares the depth at each sample in the fragment to the destination depth at the corresponding sample point. POSSIBLE VALUES: 00 - FRAG_NEVER: never pass 01 - FRAG_LESS: pass if fragment < dest 02 - FRAG_EQUAL: pass if fragment = dest 03 - FRAG_LEQUAL: pass if fragment <= dest 04 - FRAG_GREATER: pass if fragment > dest 05 - FRAG_NOTEQUAL: pass if fragment != dest 06 - FRAG_GEQUAL: pass if fragment >= dest 07 - FRAG_ALWAYS: always pass	
BACKFACE_ENABLE	7	none	If false, forces all quads to be stencil tested as frontface quads.	
STENCILFUNC	10:8	none	Specifies the function that compares STENCILREF to the destination stencil value for frontface quads. The stencil test passes if ref OP dest is true. POSSIBLE VALUES:	

	11	1	1
GTENOU FAH			00 - REF_NEVER: never pass 01 - REF_LESS: pass if left < right 02 - REF_EQUAL: pass if left = right 03 - REF_LEQUAL: pass if left <= right 04 - REF_GREATER: pass if left > right 05 - REF_NOTEQUAL: pass if left != right 06 - REF_GEQUAL: pass if left >= right 07 - REF_ALWAYS: always pass
STENCILFAIL	13:11	none	Specifies the stencil operation for frontface quads if the stencil function fails. POSSIBLE VALUES: 00 - STENCIL_KEEP: New value = Old Value 01 - STENCIL_ZERO: New value = 0 02 - STENCIL_REPLACE: New value = STENCILREF 03 - STENCIL_INCR_CLAMP: New value++ (clamp) 04 - STENCIL_DECR_CLAMP: New value (clamp) 05 - STENCIL_INVERT: New value=~Old value 06 - STENCIL_INCR_WRAP: New value++ (wrap) 07 - STENCIL_DECR_WRAP: New value (wrap)
STENCILZPASS	16:14	none	Specifies the stencil operation for frontface quads if the stencil and depth functions both pass. Field Name	Bits	Default	Description	
FORMAT	2:0	none	Specifies the size of the depth and stencil components and whether depth is floating point.	
			POSSIBLE VALUES: 00 - DEPTH_INVALID: Depth and stencil surface are not valid. 01 - DEPTH_16: UNORM 16-bit depth. 02 - DEPTH_X8_24: 24-bit UNORM depth and invalid stencil surface. 03 - DEPTH_8_24: 24-bit UNORM depth and int stencil. 04 - DEPTH_X8_24_FLOAT: 24-bit float depth and invalid stencil surface. 05 - DEPTH_8_24_FLOAT: 24-bit float depth and int stencil. 06 - DEPTH_32_FLOAT: 32-bit float depth. 07 - DEPTH_X24_8_32_FLOAT: 32-bit float depth and int stencil.	
READ_SIZE	3	none	Specifies the read size: larger reads are more efficient for AGP accesses, for example. POSSIBLE VALUES: 00 - READ_256_BITS	
ARRAY_MODE	18:15	none	O1 - READ_512_BITS Specifies the tiling format for this array. DB does not support values 0, 1, 3, 7, 11, 13, or 15.	
			POSSIBLE VALUES: 04 - ARRAY_2D_TILED_THIN1: Uses 8x8x1 macro-tiles	
TILE_SURFACE_ENABLE	25	none	Enables reading and writing of the htile data. If off HiZ+S is off.	
TILE_COMPACT	26	none	If true, this surface is compacted to eliminate storage that would be unused due to multi-chip supertiling. The supertiling mode is specified in PA_SC_MULTI_CHIP_CNTL. If this bit is set, then MULTI_CHIP_SUPERTILE_ENABLE must be set in	

		PA_SC_MODE_CNTL.
ZRANGE_PRECISION	31	0 = ZMin is the base, generally set when doing a $Z > test$, $1 = ZMax$ is the base, set when generally using a $Z < test$. The value used as base has full 14 bit precision. By setting the base to Max culling has less error in a < test. Can only be changed after a full surface clear.

FORCE_HIS_ENABLE0	3:2	none	Forces hierarchical stencil culling to be enabled for compare state 0, ignoring what is in DB_SHADER_CONTROL and all other render states. POSSIBLE VALUES: 00 - FORCE_OFF 01 - FORCE_ENABLE 02 - FORCE_DISABLE 03 - FORCE_RESERVED		
FORCE_HIS_ENABLE1	5:4	none	Forces hierarchical stencil culling to be enabled for compare state 1, ignoring what is in DB_SHADER_CONTROL and all other render states. POSSIBLE VALUES: 00 - FORCE_OFF 01 - FORCE_ENABLE 02 - FORCE_DISABLE 03 - FORCE_RESERVED		
FORCE_SHADER_Z_ORDER	6	none	Forces the setting specified in DB_SHADER_CONTROL.Z_ORDER to be used for early/late/re Z+S test. If not set the shader preference is used unless precluded by other render states.		
FAST_Z_DISABLE	7	none	Do not accelerate Z clears or write operations. Prevents killing quads before detail rasterization if depth operations are needed.		
FAST_STENCIL_DISABLE	8	none	Do not accelerate stencil clears or write operations. Prevents killing quads before detail rasterization if stencil operations are needed.		
NOOP_CULL_DISABLE	9	none	Prevents hierarchically killing quads that will pass Z and Stencil, but do not write Z, Stencil or Color. This would be used to make sure ZPass counts are perfect.		
FORCE_COLOR_KILL	10	none	DB does any possible depth optimizations assuming the		

			shader results are not needed and kills all samples before the color operation.
FORCE_Z_READ	11	none	Read all Z data for a tile even if it is not needed. Used for resummarization blts.
FORCE_STENCIL_READ	12	none	Read all stencil data for a tile even if it is not needed. Used for resummarization blts.
FORCE_FULL_Z_RANGE	14:13	none	Forces hierarchical depth to treat each primitive as if its range is 0.0 -> 1.0f or not. If disabled, it is implicitly derived from DB_SHADER_CONTROL.Z_EXPORT_ENABLE and other enabling registers. Can be used to reset the Z range to 0-1 as well. POSSIBLE VALUES: 00 - FORCE_OFF 01 - FORCE_ENABLE 02 - FORCE_DISABLE 03 - FORCE_RESERVED
FORCE_QC_SMASK_CONFLICT	15	none	Forces Quad Coherency to mark a quad with a matching dtileid, x, and y as a conflict and stall it even if the sample mask doesn't overrlap.
DISABLE_VIEWPORT_CLAMP	16	none	Disables the viewport clamp, which allows Z data to go through untouched.
IGNORE_SC_ZRANGE	17	none	Ignore the SC's vertex bounds on the minZ/maxZ for a tile during HiZ.

STENCIL_REF_EXPORT_ENABLE	1	none	A shader is bound that exports a stencil ref value as an integer onto Green.		
Z_ORDER	5:4	none	Indicates Shader`s preference for which type of Z testing. The _THEN_ for early Z allows the shader to indicate a preference when EARLY_Z can`t be used. If RE_Z can`t be used then LATE_Z is. POSSIBLE VALUES: 00 - LATE_Z 01 - EARLY_Z_THEN_LATE_Z 02 - RE_Z 03 - EARLY_Z_THEN_RE_Z		
KILL_ENABLE	6	none	Shader can kill pixels through texkill.		
COVERAGE_TO_MASK_ENABLE	7	none	Use Z (2nd) Export Alpha Channel to Generate Alpha to Mask.		
MASK_EXPORT_ENABLE	8	none	Use Z (2nd) Export Blue Channel as sample mask for pixel.		

DUAL_EXPORT_ENABLE	9	none	Allows the shader export block to pack two quads into each export to the backend. This only occurs if there is no depth export, the active render targets permit (see CB_COLOR0_INFO SOURCE_FORMAT field) and CB_COLOR_CONTROL FOG_ENABLE and MULTIWRITE_ENABLE are both zero.
EXEC_ON_HIER_FAIL	10	none	Will execute the shader even if Hierarchical Z or Stencil would kill the quad. Enable if the pixel shader has a desired side effect not covered by the above flags for Z or Stencil failed pixels. EarlyZ and ReZ kills will still stop the shader from running.
EXEC_ON_NOOP	11	none	Will execute the shader even if nothing uses the shader's color or depth exports. Enable if the pixel shader has a desired side effect not caused by the above flags for passing pixels.

READ_SIZE	15	none	Specifies the preferred read size: larger reads are more efficient for PCIE accesses, for example.

			POSSIBLE VALUES: 00 - READ_256_BITS 01 - READ_512_BITS
COMP_SWAP	17:16 none	Specifies how to map the red, green, blue, and alpha components from the shader to the components in the frame buffer pixel format. There are four choices for each number of components. With one component, the four modes select any one component. With 2-4 components, SWAP_STD selects the low order shader components in little-endian order; SWAP_ALT selects an alternate order (for 4 compoents) or inclusion of alpha (for 2 or 3 components); and the other two reverse the component orders for use on big-endian machines. The following table specifies the exact component mappings: 1 comp std alt std_rev alt_rev\	
			comp 0: red blue alpha alpha comp 1: green green blue red comp 2: blue red green green comp 3: alpha alpha red blue
			POSSIBLE VALUES: 00 - SWAP_STD: standard little-endian comp order 01 - SWAP_ALT: alternate components or order 02 - SWAP_STD_REV: reverses SWAP_STD order 03 - SWAP_ALT_REV: reverses SWAP_ALT order
TILE_MODE	19:18	none	Selects how and whether to use per-tile CMASK and FMASK per-tile data with this surface.
			POSSIBLE VALUES: 00 - TILE_DISABLE: do not access any per-tile data 01 - TILE_CLEAR_ENABLE: allow background clear only 02 - TILE_FRAG_ENABLE: allow background clear and multi-sample fragment masks

BLEND_CLAMP	20	none	Specifies whether to clamp source data to the render target range prior to blending, in addition to the postblend clamp. This bit must be zero for uscaled, sscaled and float number types and when blend_bypass is set.
CLEAR_COLOR	21	none	If false, use RGB=0.0 and A=1.0 (0x3f800000) to expand fast-cleared tiles. If true, use the CB_CLEAR register values to expand fast-cleared tiles.
BLEND_BYPASS	22	none	If false, blending occurs normaly as specified in CB_BLEND#_CONTROL. If true, blending (but not fog) is disabled. This must be set for the 24_8 and 8_24 formats and when the number type is uint or sint. It should also be set for number types that are required to ignore the blend state in a specific aplication interface.
BLEND_FLOAT32	23	none	If true, use 32-bit float precision for source colors, else truncate to 12-bit mantissa precision. This applies even if blending is disabled so that a null blend and blend disable produce the same result. This field is ignored for NUMBER_UINT and NUMBER_SINT. It must be one for floating point components larger than 16-bits or non-floating components larger than 12-bits, otherwise it must be 0.
SIMPLE_FLOAT	24	none	If false, floating point processing follows full IEEE rules for INF, NaN, and -0. If true, 0*anything produces 0 and no operation produces -0.
ROUND_MODE	25	none	This field selects between truncating (standard for floats) and rounding (standard for most other cases) to convert blender results to frame buffer components. The ROUND_BY_HALF setting can be over-riden by the DITHER_ENABLE field in CB_COLOR_CONTROL. POSSIBLE VALUES: 00 - ROUND_BY_HALF: add 1/2 lsb and then truncate 01 - ROUND_TRUNCATE: truncate toward zero for float, else toward negative
TILE_COMPACT	26	none	If true, this surface is compacted to eliminate storage that would be unused due to multi-chip supertiling. The supertiling mode is specified in PA_SC_MULTI_CHIP_CNTL. If this bit is set, then MULTI_CHIP_SUPERTILE_ENABLE must be set in PA_SC_MODE_CNTL.
SOURCE_FORMAT	27	none	This field indicates the allowed format for color data being exported from the pixel shader into the output merge block. This field may only be set to EXPORT_NORM if BLEND_CLAMP is enabled, BLEND_FLOAT32 is disabled, and the render target has only 11-bit or smaller UNORM or SNORM components. Selecting EXPORT_NORM flushes to zero values with exponent less than 0x70 (values less than 2^-15).

	POSSIBLE VALUES: 00 - EXPORT_FULL: PS exports must use the full 32-bits per component 01 - EXPORT_NORM: PS exports may use a 16-bit
	per component format that supports 11-bit or smaller UNORM, SNORM, and SRGB

CMASK_BLOCK_MAX	11:0		This field equals one less than the number of 128x128 blocks of color mask data per 2D slice. For R600, 4-bit CMASK values are stored in macro-tiles that have pixel width and height determined by computing sqrt(Pipes*16K and rounding up (for width) or down (for height) to the nearest power of two. The pitch for the Cmask array is derived from PITCH_TILE_MAX, padding to the nearest multiple of the macro tile width.	
FMASK_TILE_MAX	31:12		This field equals one less than the number of 8x8 tiles of fragment mask data per 2D slice. For R600, FMASK values are stored in macro-tiles that have pixel width and height determined TBD. The pitch for the Fmask array is derived from PITCH_TILE_MAX, padding to the nearest multiple of the macro tile width.

PITCH_TILE_MAX	9:0	none	Define Pitch as the number of data elements per scanline. This field equals (Pitch/8) - 1, which equals the maximum 8x8 tile number allowed in the X dimension for the surface.		
			Allowed values for Pitch depend on ARRAY_MODE, ElemBytes (the number of bytes per data element: 1 to 16), and Samples (the number of multi-samples per pixel: 1, 2, 4, or 8). It also depends on two configuration parameters that are the same for all resources: GroupBytes (the bytes per memory interleave group: 256 or 512), and Banks (the number of DDRAM banks: 4 or 8).		
			Linear: Pitch*ElemBytes is a multiple of GroupBytes and Pitch is a multiple of 64 1D tiled: Pitch*8*ElemBytes*Samples is a multiple of GroupBytes and Pitch is a multiple of 8 2D/3D tiled: Pitch*8*ElemBytes*Samples/Banks is multiple of GroupBytes and Pitch is a multiple of 8*Banks/Factor		

			where Factor is 1, 2, or 4 for THIN1/THIN2/THIN4 2B/3B tiled: also padded to bank swap boundaries, which are determined from GB_TILING_CONFIG fields In addition to these constraints
SLICE_TILE_MAX	29:10	none	Define SliceTiles as (Pitch*Height/64). This field equals SliceTiles-1, and is the maximum allowed 8x8 or 64x1 tile number within an (x,y) slice of a 2D or 3D surface. The following constraints apply to allowable heights and z-depths for resources (see the ARRAY_MODE field): All cases: Height is in the range [18192]. 1D tiling: Height is a multiple of 8. 2D THIN1 tiling: Height is a multiple of 8*Pipes 2D THIN2 tiling: Height is a multiple of 16*Pipes (and pitch is a multiple of 4*Banks) 2D THIN4 tiling: Height is a multiple of 32*Pipes (and pitch is a multiple of 2*Banks) 2D THICK tiling: Height is a multiple of 8*Pipes and z-depth is a multiple of 4 Note: Pitch, height and Z-depth must be powers of 2 for mipmap chains (other than the base map).

0	none	If true, extract a fog factor from each exported color and performs fog blending prior to alpha blending, using FOG_RED etc. as the fog color. This bit must be zero if a dual-source (SRC1) blend operation is selected.
1	none	If true, replicate color output 0 to each color output, so taht it is rendered to each enabled render target. This feature is used in OpenGL. SHADER_MASK.OUTPUTn_ENABLE masks the color components of color output 0 for render target n.
2	none	If true, then each component is dithered if it is no larger than 16-bits and its ROUND_MODE is set to ROUND_BY_HALF. This API state is present in OpenGL and DX9 but not DX10.
3	none	If true, then each UNORM format COLOR_8_8_8_8 render target is treated as an SRGB format instead. This API state is present in DX9 but not WGF2.
6:4	none	This field selects stanard color processing or one of several special operation modes, which ignore the backend state except that the fast clear and expand modes use nonzero fields in CB_TARGET_WRITE field to select render targets. NOTE: for the SPECIAL_EXPAND modes, all enabled MRTs must have a cmask buffer.
		POSSIBLE VALUES: 00 - SPECIAL_NORMAL: use state to render 01 - SPECIAL_DISABLE: do not write color results 02 - SPECIAL_FAST_CLEAR: set fully covered tiles to fast clear value, as selected by CLEAR_MODE field. 03 - SPECIAL_FORCE_CLEAR: use for full surface
		fast clear (removes knowledge of prior clear color). 04 - SPECIAL_EXPAND_COLOR: expand cleared tiles so that clear color is not used. Use this or force_clear when changing the clear color. 05 - SPECIAL_EXPAND_TEXTURE: expand as needed before binding the surface as a texture. 06 - SPECIAL_EXPAND_SAMPLES: expand to a export_ separate color per sample. This is required before CPU access to the surface. 07 - SPECIAL_RESOLVE_BOX: read from target 0, sum all covered samples samples, divide by the number of samples, and write to target 1, which is one-sample. This may be used to produce a linear array from a tiled array.

PER_MRT_BLEND	7	none	If false, use CB_BLEND_CONTROL for all blend functions. If true, use CB_BLEND#_CONTROL for the blend function for render target # (if blending is enabled).
TARGET_BLEND_ENABLE	15:8	none	Each bit enables blending for the corresponding render target if it is 1, else disables blending for that render target if it is 0. This field must be 0xcc (source) if BLEND_FLOAT32 is set for any enabled render target.
ROP3	23:16	none	This field supports the 28 boolean ops that combine either source and dest or brush and dest, with brush provided by the shader in place of source. ROP3 codes that use both src and brush are emulated in software. Allowed ROP3 codes have either the form pqrspqrs (for source/dest ops) or pqpqrsrs (for brush/dest ops). The code 0xCC (11001100) copies the source to the destination, which disables the ROP function.

CB:CB_SHADER_MASK · [R/W] · 32 bits · Access: 32 · GpuF0MMReg:0x2823c				
DESCRIPTION: Contains color component mask fields for the colors output by the shader. Outputs 1-7 are defined equivalently to output 0.				
Field Name	Bits	Default	Description	
OUTPUT0_ENABLE	3:0		If zero, this field disables writes to render target 0, else it specifies which components are enabled in the shader. The low order bit corresponds to the red channel. A one bit bit passes the shader output component value to the color block. A zero bit replaces the component with the default value: 0.0 for RGB or 1.0 for alpha.

DESCRIPTION: Contains color component mask fields for writing the render targets. Red, green, blue, and alpha are components 0, 1, 2, and 3 in the pixel shader and are enabled by bits 0, 1, 2, and 3 in each field. Note that the components may be in a different order in the frame buffer, depending on the COMP_SWAP field. Targets 1-7 are defined equivalently to output 0.

Bits	Default	Description		
3:0	none	Enables writing to render target 0 components. The low order bit corresponds to the red channel. A zero bit disables writing to that channel and a one bit enables writing to that channel. If blending is enabled, all components are read from the frame buffer, regardless of this mask value. Any components that are missing due to the element format are replaced with their default value: 0.0 for color or 1.0 for alpha.
